Published November 2026

Abstract

This paper explores how good quality onboarding can influence employee job satisfaction. Areas explored include structured onboarding, role definition, occupational specific training, employee supervision and provision of feedback together with social inclusion. An individual's onboarding experience encompasses the information, competences, connections and comprehension that they develop so that they can effectively function within an organisation. Secondary data has been analysed in a descriptive and analytical manner. Peer-reviewed journal articles, meta-analyses and systematic reviews have therefore been utilised. Primary research such as surveys and interviews were not undertaken. Consequently, no original staff data was collected.

There is already evidence to suggest that employee adaptation is positively related to their job satisfaction. Bauer et al. (2007) analysed 70 distinct studies and identified that elements of role definition, self-efficacy and social inclusion are key in understanding the link between onboarding and subsequent outcomes such as job satisfaction. Their 2025 review and meta-analysis of 256 studies similarly shows that employee adaptation is positively related to job satisfaction. This includes perceived fit (r = .46), social inclusion (r = .42), role definition (r = .38) and task competence (r = .32).

Frögéli et al. (2023) performed a review of five studies which involved a total of 1,556 early career professionals. Of these, 3 showed that onboarding had a significant influence on employee adaptation. Structured and facilitated work-based training was most strongly supported as an onboarding method. However, the review concluded that there was generally low confidence in the evidence presented. Overall, this paper highlights that onboarding must be recognised as an evolving employee experience and not simply a single day induction process.

1 Introduction

Initial weeks and months within employment are key for understanding, carrying out tasks and interacting within an organisation. People can find it difficult to adapt to a new environment and so must become accustomed to new processes, policies and culture. Furthermore, individuals need to grasp the requirements of their position and comprehend how they will be evaluated. Relationships also need to be established with both line managers and fellow staff. The term onboarding describes the methods used by organisations to facilitate an individual's adaptation to a new environment.

Unlike a one-off induction, onboarding is an ongoing process. Whilst inductions commonly provide people with information about fundamental policy, environment and processes, onboarding further assists individuals in adapting to a new environment. It can encompass, for example, pre-employment information sharing, a formal onboarding programme, role specific training, mentorship and feedback. In addition, interaction with others can be encouraged. Well organised and executed

onboarding is likely to increase an individual's comprehension of what is required of them as well as providing them with the support they need.

Job satisfaction is a person's general attitude towards and assessment of their job. It can be affected by various factors such as the type of work undertaken, management style, team dynamics, appreciation, progression prospects and environment. An individual's onboarding experience can impact upon these variables. For instance, good information provision can enhance an individual's understanding of their role. Likewise, support from managers and staff can make people feel they are part of the team and encourage them to seek advice where appropriate.

Literature concerning the socialisation of people within organisations is helpful in further analysing how onboarding may affect job satisfaction. Notably, studies have emphasised the significance of role clarity, self-efficacy and social integration for newly employed people and how these can in turn impact upon job satisfaction and further outcomes (Bauer et al., 2007). Moreover, recent work has also underlined the importance of perceived congruence and skill accomplishment (Bauer et al., 2025). This paper therefore analyses the links between the standard of onboarding and job satisfaction and evaluates ways in which people can successfully adapt to new positions.

1.1 Purpose of the study

This paper will explore the link between onboarding quality and levels of employee job satisfaction, analyse the processes by which onboarding can affect an individual's level of job satisfaction and then offer suggestions as to how organisations can enhance a new employee's experience.

1.2 Objectives of the study

1. Investigate the effect that an organisations' onboarding has on staff job satisfaction.
2. Review current research and uncover areas which have yet to be explored in relation to onboarding quality.
3. Suggest effective ways to enhance both an organisations' onboarding and staff job satisfaction.

1.3 Significance of the study

This research is applicable to HR professionals, line managers and companies wishing to enhance the employee experience. It demonstrates that onboarding is not only an operational function, but also has impacts on new-joiner perception, self-efficacy and integration.

2 Literature review

2.1 Organisational socialisation and newcomer adjustment

A meta-analysis was undertaken by Bauer et al. (2007), analysing 70 distinct samples of new employees. It postulated that employee role clarity, self-efficacy and acceptance were mechanisms through which an organisation's socialisation practices affected employee outcomes including satisfaction, organisational commitment, performance, retention intention and turnover. Overall the findings substantiated this. Therefore it appears that an individual's satisfaction can be impacted by their onboarding experience through them gaining role clarity, feeling confident in their skills and being accepted into a team.

2.2 Onboarding practices and organisational support

Klein and Polin (2012) identified both theoretical and practice views of induction. Often advice is given which does not fully address the issues that need to be considered when creating appropriate inductions. Information should be provided, employees should be made to feel part of the organisation and there should be support available for learning. Thus once again demonstrating that induction must involve much more than just providing an induction pack and filling in forms.

2.3 Evidence on formal onboarding programmes

A systematic review of structured induction processes for professionals was undertaken by Frögéli et al. (2023). Within the 5 studies comprising 1556 individuals, there were 3 that found a statistically significant impact of an inductions process or programme on an individual's integration. It appeared that structured and facilitated experiential learning was most favoured within these studies. Nevertheless, the body of evidence was identified as being of low confidence and further high quality research was suggested.

2.4 Updated meta-analytic evidence

A total of 256 studies were assessed and 183 used within a meta analysis (Bauer et al., 2025). This research explored an organisations' socialisation methods, internal coaching and support mechanisms, along with newly recruited employee actions and adaptation. Emphasis was placed on the importance of employees feeling accepted and that they 'fit-in'. Subsequent to effective socialisation, job satisfaction can then be achieved.

2.5 Newcomer proactive behaviour

Zhao et al. (2023) conducted a meta-analysis on 45 separate studies involving 11,508 individuals to analyse new employee proactivity. This involves sensemaking, relationship development, positive perspective taking and re-negotiating work. Overall, evidence has shown that being proactive can be advantageous for new employees in terms of their socialisation. Thus, it is important that onboarding is participatory. Employees should feel able to both ask questions and receive feedback and an organisational culture should be fostered where proactivity is valued.

3 Research gap

It is known that organisational socialisation relates to an employee's adaptation. Meta-analyses show that job role understanding, self-efficacy, and/or competence; feelings of belonging and a sense of fit are all key variables relating to job satisfaction. Structured and facilitated workplace learning has also been recognised as a potentially effective onboarding method within systematic reviews.

Whilst there are still areas where knowledge is lacking, studies commonly consider organisational socialisation in a general form. Organisations may benefit further from knowing which aspects of onboarding (for example, pre-employment information sharing, induction, line manager meetings, mentoring and training) are most significantly related to an employee's satisfaction. Furthermore, the systematic review by Frögéli et al. (2023) identifies issues with both the quality and volume of evidence regarding interventions. People's onboarding experiences may also vary, depending on industry, position, working pattern and/or culture. Further long-term research is also required to assess if initial onboarding experiences have enduring links to subsequent job satisfaction.

This paper collates information about onboarding quality and primary adaptation processes. It then pinpoints areas for assessment within future, organisation-focused research. However, it does not present novel survey data or a causal measurement for a specific organisation or group.

4 Research methodology

4.1 Research design

The research uses a descriptive and analytical secondary data design. It identifies key factors which define quality within the onboarding process and explores links between these and new employees' adaptation and satisfaction. This is not primarily primary data collection.

4.2 Nature of research

This is a qualitative analysis underpinned by quantitative information collated within published meta-analysis and systematic review studies. There was no collection of employee data such as through questionnaires or interviews. Consequently, information has been collated from existing sources.

4.3 Sources of data

Sources used are mainly academic in nature, such as journal articles, meta-analysis, systematic review and book chapter. Emphasis is placed on studies investigating aspects of socialisation, onboarding, adaptation and employee job satisfaction. Key references include Bauer et al. (2007); Klein and Polin (2012); Frögéli et al. (2023); Zhao et al. (2023) and Bauer et al. (2025).

4.4 Scope of the study

New starters are the main concern when considering onboarding. This may start prior to starting work and last for some time after. Job satisfaction is the primary goal. People gain a better understanding of their job, become proficient at it and are accepted within the workplace. They also feel they are a good match for their position.

4.5 Conceptual framework

Quality of onboarding will impact how well an individual adapts and is subsequently linked to job satisfaction. Quality onboarding encompasses good communication, induction, appropriate training, line management, team/ buddy support and feedback and cultural inclusion. The framework is summarised in Table 1.

Table 1. Conceptual framework: onboarding quality, newcomer adjustment and work outcomes.

Onboarding quality inputs	Newcomer adjustment	Expected work outcomes
Information; orientation; training; supervision; team and colleague support; evaluation; organisational culture and values.	Role clarity; task mastery; social acceptance; perceived fit	Increased job satisfaction and organisational involvement together with reduced attrition rates.

This model aligns with organisational socialisation models that have been identified within the literature. However, it is not a quantitative model based on analysis of primary data.

4.6 Hypotheses

H1: Quality of onboarding relates positively to employee job satisfaction.

H2: Employees also relate positively to job role understanding and competence.

H3: Furthermore, employees relate positively to social inclusion and a sense of belonging within an organisation.

H4: Support from supervisors, mentoring and feedback all further enhance the relationship between the quality of onboarding and an individual's integration into an organisation.

4.7 Study limitations

Secondary data is used and may utilise differing terminology, metrics, populations and timescales. Correlation does not imply causation. Furthermore, this paper is not undertaking primary research into employee experience within India and so is unable to assess the standard of induction and/or levels of employee satisfaction at a particular Indian business.

5 Findings

Themes emerge that can be identified throughout. High quality on-boarding can be defined as comprising information provision, advice and development, alongside interpersonal interaction. Adaptation to a new environment is also a key interface between on-boarding and subsequent employee attitude. Of specific relevance are social integration and feelings of congruence, which have been shown through recent meta-analysis to have strong associations with employee satisfaction.

5.1 Finding 1: Adjustment indicators are positively associated with job satisfaction

There is a positive relationship between job satisfaction and new employee integration factors (Bauer et al., 2025). Of these, perceived fit was found to have the highest association with job satisfaction (r=.46). Social integration (r=.42), role understanding (r=.38) and skill competence (r=.32) also showed positive relationships. As with all meta-analytic results, these are not to be interpreted as cause and effect relationships and do not represent a percentage of employees that were found to be satisfied.

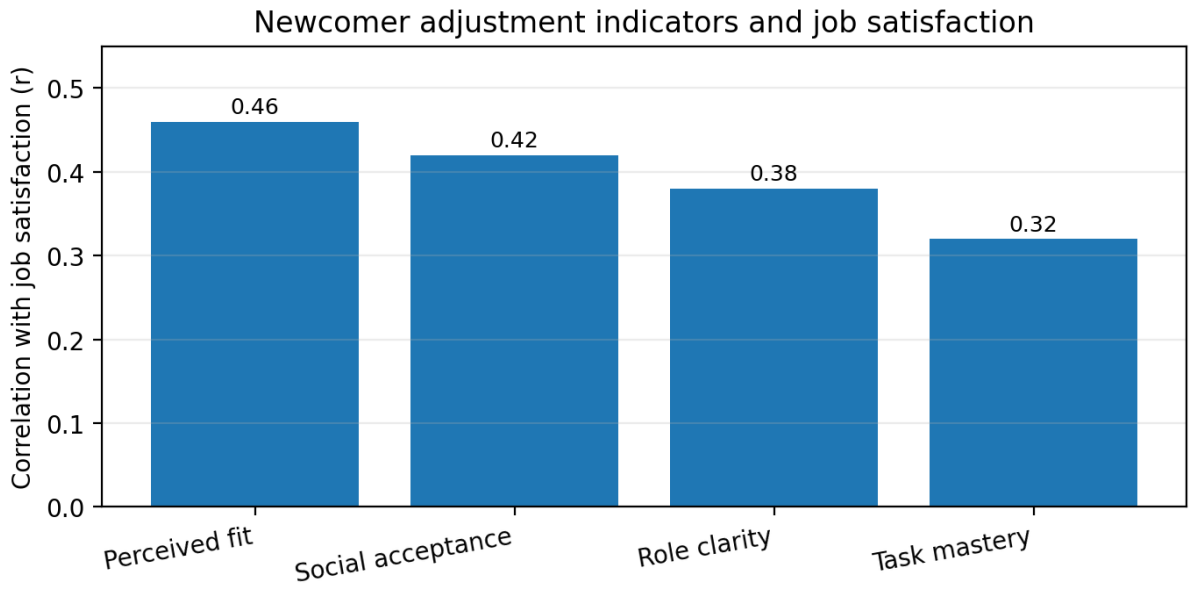

Figure 1. Meta-analytic correlations between newcomer adjustment indicators and job satisfaction.

5.2 Finding 2: Structured and supported training is important

A systematic review of 5 studies was analysed in relation to new professionals (n=1556). Three studies identified that there were statistically significant outcomes for new professionals' adjustment following engagement with onboarding processes. Within the range of strategies investigated, structured and facilitated workplace learning was most favoured. However, the review stressed that research is currently restricted and further high quality research is required.

5.3 Finding 3: Social acceptance is a key part of the newcomer experience

Bauer et al. (2025) emphasise that social acceptance is key when adapting to a new environment. Therefore, induction should enable staff to form links with others, both peers and superiors. An individual can be competent at their role however, still be unhappy if they are unable to participate in social interaction, group work and/or decision making.

5.4 Finding 4: Role clarity reduces uncertainty

Well defined roles, expectations, lines of communication and goals can also aid adaptation. Role clarity is highlighted by Bauer et al. (2007) as an important mediator between socialisation and variables such as job satisfaction.

5.5 Finding 5: Onboarding is a shared responsibility

The HR department can manage the process, line managers can define and give feedback around the role and peers can assist. New staff can also enquire and engage. Thus a good on-boarding process involves everyone within an organization.

6 Discussion

6.1 Onboarding quality and employee job satisfaction

Evidence demonstrates that good induction can influence job satisfaction. As individuals consider their job; aspects covered during an induction can play a part in their perception of it. Good information provision helps to alleviate confusion. Training can also be used to boost self-efficacy and good interpersonal connections can encourage a sense of community. Such factors may in turn lead to an improved job perception.

Whilst good induction is key in creating a satisfying work environment, people may also be influenced by other variables such as salary, hours worked, management and work-life balance as well as progression prospects, perceptions of fairness and role design. Good induction will not fully overcome bad working environment and/or management. Therefore it should be seen as the initial stage in creating a good employment relationship.

6.2 The role of social acceptance and organisational fit

Much recent meta-analysis has highlighted the importance of belonging and feeling one 'belongs'. In addition to knowledge and processes, people require information about workplace culture. They also require time to build relationships with others, engage in interaction and discover how decisions are reached. People can then feel more at ease in approaching others and sharing their thoughts if they feel they belong.

6.3 The role of training and role clarity

Staff require training relating to their area of work so that they can feel confident within their role. Appropriate training can include showing, supervising, observing and providing staff with feedback. Furthermore, managers must convey information regarding key areas of work, required quality and methods of assessment.

6.4 Onboarding in hybrid and remote work settings

Informal learning is often harder to access in a hybrid or remote workplace. Individuals may lack understanding of who they can approach to receive rapid responses. Structures, information and online on-boarding and review processes should therefore be formally set out. Having a nominated 'buddy' or mentor can also assist individuals to combat loneliness and further facilitate their social inclusion.

6.5 Implications for organisations

Alongside (or as well as) assessing that people have been through a process of induction, organisations should look at whether members of staff are knowledgeable, skilled, integrated and self-assured. Feedback can be gathered at 1 week, 1 month and 3 months in relation to areas such as understanding of role, skill levels, availability of support, integration and general satisfaction.

7 Conclusion

This paper analysed the effects of an individual's onboarding experience on their job satisfaction. Literature suggests that onboarding is integral to an employee's induction, and can be used to both educate and boost an employee's self-efficacy and assist them in assimilating into an organisation.

There is good evidence that there is a positive relationship between an individual's adaptation and their level of job satisfaction. A meta-analysis identified key factors in the adaptation process including role clarity, self-efficacy and social integration (Bauer et al., 2007). Additionally, Bauer et al. (2025) identified positive links between individuals' perception of fit, social integration, role clarity and skill acquisition and job satisfaction. Frögéli et al. (2023) also produced encouraging results relating to the influence of formal and facilitated experiential learning. However, they point to issues regarding the quality of research into interventions.

Good onboarding is essential and should be ongoing, formal and facilitated. It should include provision of information, experiential learning, approachable management and colleagues, plus a feedback mechanism. These can aid an individual's adaptation and enable them to have a good initial experience. Whilst onboarding is an important element of influencing someone's job satisfaction, there are numerous other elements that can affect it.

8 Recommendations

- Outline the induction process, along with key documentation and details about an individual's role and contacts.
- Structure a person's initial 1, 2 and 3 month period so they can learn about the business, team, processes and their role.
- Undertake hands-on and facilitated training. This may include examples, supervised practice and the facility to seek advice.
- Clarify an individual's role, requirements and key areas of focus together with their lines of reporting.
- Match individuals with an appropriate trained mentor or buddy to assist them in developing networks and understanding how the workplace functions.
- Supervisors should meet with new members of staff within the initial 30, 60 and 90 days to review development, explore any issues and identify where further support may be required.
- Obtain feedback from new recruits to continually enhance the induction process. Success should not solely be measured by someone completing an induction.
- Customise inductions to suit differing roles and working patterns – for example, both hybrid and remote workers.

9 Limitations and further research

No primary data, such as surveys, interviews and/or organisation analysis has been gathered so it is not possible to accurately analyse the effect on job satisfaction of the quality of onboarding in an organisation, industry and/or country. As noted previously there are variations in how onboarding is defined, and in the samples and methodologies of studies undertaken.

A systematic review was completed (Frögéli et al., 2023) but only five studies were analysed and this resulted in 'low confidence' in the evidence. Although meta-analytic correlation data is an effective source of evidence, it does not automatically show that good onboarding practice results in greater job satisfaction. Additionally, pre-existing job satisfaction and proactivity can affect someone's perception of onboarding. Furthermore, wider aspects of an organisation can also affect job satisfaction.

Primary data could be obtained from employees in Indian organisations in industries including banking, retail, manufacturing, IT and hospitality. Using a longitudinal approach, onboarding quality and job satisfaction could be analysed at 1, 3 and 6 months post-employment. Comparisons could then be made between the effects of face-to-face, blended and remote onboarding. The effect of supervision and/or mentoring on the connection between onboarding quality and job satisfaction could also be investigated.

Studies should continue to use validated tools. Researchers must also transparently convey the nature of their samples and identify specific onboarding elements. This will enable organisations to recognise which onboarding practices are most beneficial for various types of employees.
