Abstract- Senna alata is a plant found in Africa and other tropical regions of the world. Senna alata has been used traditionally for the treatment of different ailments. That is the reason why we investigated the presence of phenolics and other bioactive compound in the methanolic extract of Senna alata. Standard GC-MS and HPLC procedures were carried out on the extract. The results showed the presence of Methyl-4-(3-oxocyclohexyl)-butanoate with a peak number 13, retention time 14.782 and % area of 8.13, another detected bioactive with higher % area of 5.05 and retention time 16.467 was n-hexadecanoic acid methyl ester with a peak number 21 and Quercetrin 155.39 mg/100g > cinnamic acid 107.04 mg/100g > naringin 82.26 mg/100g > apigenin 66.75 mg/100g > caffeic acid 45.05 mg/100g > quercetin amongst others. In conclusion Senna alata extract contained important phenolics and other bioactive compounds that are of importance in health and disease.

I. INTRODUCTION

Phenolics are a class of organic compounds that occurs in all plants as secondary metabolites in varying concentrations (Evans and Harbone, 1999). They are diverse group of biocompounds with simple chemical structures like C₆ – phenolics, C₆-C_n, C₆-C_n-C₆ among other complex structures (Evans and Harbone, 1999). Phenolic compounds from plants contribute to their quality, nutritional value, aroma and flavour. They are also known to provide the greatly to the beneficial health effects of many plants, such as anti-tumour, anti-ulcer and anti-inflammatory properties, (Konczak-Islam et al., 2003; Stintzing and Carle, 2004) especially due to their high medicinalactivity. Nowadays, efforts are made to find new sources of natural phenolic. (Ignat et al., 2011).

Senna alatais a medicinal/ therapeutic plant used throughout areas in which it is found. It is used widely in traditional medicine in the Niger Delta Region of Nigeria. Sennaalata leaf extract is used to treat constipation, inguinal hernia, intestinal parasitosis, syphilis, and diabetes (Dutta*et al.*, 2012).

There are no or scarce research works that explore the quantification of phenolics in methanolic extract of *Senna alata* utilizing HPLC and also detecting other bioactive compounds with the aid of GC-MS. That is why this work was carried out.

II. MATERIALS AND METHODS

• PLANT MATERIAL

Fresh leaves of *Senna alata* were collected from Amassoma Community, Sothern Ijaw L. G. A Bayelsa State. The plant was identified by the Department of Botany, Niger Delta University, Bayelsa State. Plant was collected in November, 2021.

• PREPARATION OF METHANOIC EXTRACTS OF SENNA ALATA

Senna alata leaves were harvested and dried in the shade for 14 days. The grounded plant was marcerated in 1500ml methanol for three days (72 hours). The crude extract was then filtered with Whattman number 1 filter paper. The extract was evaporated to dryness in a rotary evaporator. The resulting paste was weighed and found to be 28.1g. It was then put in the refrigerator to be used later.

 DETECTION OF PHENOLICS IN SENNA ALATA METHANOL EXTRACT

HPLC MAKE	Agilent 1200 series
Detector	Agilent 1260
Wavelength	320 nm
Column	Chromspher 5, C18
Column temperature	40 °C

Dimension	5 mm, 3mm x 250 mm,
	with Hamilton
	microliter syringe
Injection volume	100 µL
Flow rate	0.7 ml/min
Pressure	180 x 10 ⁵ Pa
Isocratic elution	2% acetic acid in water-
	methanol mixture
	(82:18, v/v)

Gas chromatography- mass spectrophotometry analysis (GC-MS Analysis) was carried out according to manual guidelines and standard principles of operation. III. RESULTS

Fig 2 showing the chromatogram of biocompounds in methanolic extract of Senna alata

The phenolics detected in Senna alata methanolic extract via HPLC are displayed in table 1. Quercetrin 155.39 mg/100g > cinnamid acid 107.04 mg/100g > naringin 82.26 mg/100g > apigenin 66.75 mg/100g > caffeic acid 45.05 mg/100g > quercetin 36.08 mg/100g > kaempferol 37.01 mg/100g > p-hydroxybenzoic acid 23.32 mg/100g > catechin 14.51 mg/100g. These phenolic compounds and others on table 1 contribute greatly to the health benefits of Senna alata. Phenols detected in large and minute quantity as shown in table 1 have several mechanisms of action, like protection of membrane layers, metal coordination, free radical quenching, modulation of oxidative and antioxidative enzymes the potency of these abilities relies on the number and position of free OH groups and the stereochemistry of the phenol ring (Panche et al., 2016; Benjakul et al., 2014).

RT = retention time

Methyl-4-(3-oxocyclohexyl)-butanoate is one of the biocompounds detected in the methanolic extract of senna alata with a peak number 13, retention time 14.782 and % area of 8.13, another detected bioactive with higher % area of 5.05 and retention time 16.467 was n-hexadecanoic acid methyl ester with a peak number 21. Methyl cis-9-octadecenoate was also found in higher concentration because it showed % area of 12.22, RT of 17.930 and a peak number of 24. Trans -1,3-trans-1,4-menthol and (5-methyl-3-benzoburyl)-phenyl methanone have peak number 26 and 34, they are eluted at RT of 18.107 and 20.860 with % area of 7.11 and 27.67 respectively.

In general, HPLC and GC-MS data showed that the leaves of *Senna alata* methanolic extract under study contained high amounts of bioactive compounds and high amounts of phenol is a valuable source of health-promoting compounds.
